

Programmable USB Hub Datasheet

S77-USBHub-2x4

Overview

The USBHub2x4 is a 4-port software-programmable USB 2.0 (480Mbps) hub that is designed for demanding industrial environments where advanced control and monitoring of USB ports is required. This is very useful in testing or development environments where standard "always-on" behavior of a consumer-grade USB hub is not desirable.

Software control of the USBHub2x4 is established and maintained over the selected one of the two available host-facing ports.

The USBHub2x4 can be used to enable/disable individual USB ports, measure current or voltage on downstream USB ports, set programmable current limits, set USB charging protocol behavior and otherwise automate USB port behaviors in development and testing.

Typical applications include:

- USB device manufacturing
- USB device validation and development
- Functional testing
- Camera control
- Battery charging
- USB device resets
- USB monitoring
- Sequential firmware load/updates

Features

- Individually enable/disable any of 4 downstream ports
- Data and power lines can be separately enabled for each downstream port
- Measure voltage and current on each downstream port
- Set programmable current limits for each downstream port (500mA to 2.5A)
- Automatic or programmed selection for either of 2 host port connections
- All ports support USB link speeds up to 480Mb/s
- Selectively enable USB charging mode behaviors: SDP (Standard Downstream Port) or CDP (Charging Downstream Port) modes¹
- Deliver up to 2.5A per port (in CDP mode)
- Set enumeration delay for discovery of attached downstream devices
- Boost USB upstream and downstream data signal levels
- DIN-rail mountable
- Certified to withstand +/- 30kV ESD strikes (IEC6100-4-2 level 4)

Description

The USBHub2x4 gives engineers advanced flexibility and configurability over USB ports in testing and development applications.

Each downstream USB channel implements separately and independently switched data lines and 2500mA current-limited power lines. USB power and data can be independently disconnected for advanced USB testing applications. Pin interfaces are protected against reverse polarity and overvoltage, and connections are designed to operate from 0°C to 50°C ambient with no external cooling or fans.

Each USBHub2x4 is uniquely addressable and controllable from a host PC via the selected USB host input. Acroname's BrainStem[™] link is then established over the USB input and allows a connection to the on-board controller in the USBHub2x4. USBHub2x4 can be controlled via a host running BrainStem APIs or alternately, it can operate independently by running locally embedded, user-defined programs based on Acroname's BrainStem Reflex language.

¹ See <u>http://www.usb.org/developers/docs/devclass_docs/</u> under the category Battery Charging for full details.

Absolute Maximum Ratings²

Stresses beyond those listed under ABSOLUTE MAXIMUM RATINGS can cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under RECOMMENDED OPERATING CONDITIONS is not implied. Exposure to absolute-maximum rated conditions for extended periods affects device reliability and may permanently damage the device.

Parameter	Minimum	Maximum	Units
Input Voltage, V _{supply}	6.0	26.0	V
V _{supply} current	0.0	14.0	A
Input Power		85	W
V _{bus} Ouput Power		50	W
Voltage on V _{bus} inputs	0.0	24.0	V
Voltage on V _{bus} outputs	0.0	6.0	V
Voltage on any USB D+/D- inputs and outputs	-0.3	5.3	V
Altitude	-	2000	М
Overvoltage	-	Overvoltage Category II	-

Table 1: Absolute Maximum Ratings

Handling Ratings

Parameter	Conditions/Notes	Minimum	Typical	Maximum	Units
Ambient Operating Temperature, TA	Non-Condensing	0.0	25.0	50.0	°C
Relative Humidity Range	Non-Condensing	5	-	95	%RH
Storage Temperature, TSTG		-10.0	-	85.0	°C
Electrostatic Discharge, V _{ESD}	Exceeds IEC 61000-4-2, level 4, air and contact discharge	0.0	-	±30	kV

Table 2: Handling Ratings

Recommended Operating Ratings

Specifications are valid at 25°C unless otherwise noted. Intended for indoor use only.

Parameter	Conditions/Notes	Minimum	Typical	Maximum	Unit
Input Voltage, V _{supply}		9.0	12	24.0	V
Input Current, Isupply		0.15	-	11.0	Α
Voltage on V _{bus} inputs and outputs		4.5	5.0	5.5	V
Relative Humidity Range	Non-Condensing	5	-	95	%RH

Table 3: Recommended Operating Ratings

² If the equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.

Block Diagram

Figure 1: USBHub2x4 Block Diagram

Typical Performance Characteristics

Specifications are valid at 25°C unless otherwise noted. Indoor application use only. Sample rates are typically limited by the USB throughput of the host operating system except where bulk capture is supported.

Parameter	Conditions/Notes	Minimum	Typical	Maximum	Unit
USB Downstream (V _{bus})		4.5	5.0	5.5	V
USB Downstream Current	I _{LIM} =2.5A	0.0	-	2.5	Α
System Efficiency	@12.0V input, nominal 6.5A load ³	84	-	86	%
Current Measurement Range		6.4	-	2500	mA
Current Measurement Resolution		-	9.76	-	mA
Current Measurement Accuracy	ILIM not exceeded		±2		%
V _{bus} Voltage Measurement		0.0	-	5.5	V
V _{bus} Voltage Resolution		-	1.2	-	mV

Module Hardware and Software Default Values

The USBHub2x4 leverages a hardware-specific subset of BrainStem Entity implementations. The aUSBHub2x4.h C++ header file includes macro definitions for many parameters specific to the USBHub2x4. Table 5: USBHub2x4 Hardware and Software Default Values provides an overview of these values.

Parameter	Index	Macro Name or Implemented Options	Notes
Module Definitions:			
Module Base Address	6	aUSBHUB2X4_MODULE_ADDRESS	
Router Base Address	6		
Entity Class Definitions:			
timer Entity Quantity	8	aUSBHUB2X4_NUM_TIMERS	
usb Entity Quantity	1	aUSBHUB2X4_NUM_USB	
store Entity Quantity	2	aUSBHUB2X4_NUM_STORES	
system Entity Quantity	1		
app Entity Quantity	4	aUSBHUB2X4_NUM_APPS	
pointer Entity Quantity	4	aUSBHUB2X4_NUM_POINTERS	

Table 5: USBHub2x4 Hardware and Software Default Values⁴

⁴ Refer to aUSBHub2x4.h within the BrainStem Development Kit download for actual file.

Device Drivers

USBHub2x4 leverages operating system user space interfaces that do not require custom drivers for operation on modern operating systems.

Some older operating systems may require the installation of a BrainStem USB driver to enable software control. Installation details on installing USB drivers can be found within the BrainStem Development Kit under the "drivers" folder. For example, Windows 7 the supplied INF to communicate with BrainStem USB devices.

Capabilities and Interfaces

The USBHub2x4 is built on Acroname's BrainStem system, which provides simple high level APIs, a real-time embedded runtime engine and modular expandability. Functionality details unique to the USBHub2x4 are described in the following sections. A complete list of available API functionality specific to USBHub2x4 is listed in Table 10. All shortened code snippets are loosely based on the C++ method calls and meant to be Psuedocode like – Python and Reflex are virtually the same. Please consult the online BrainStem Reference for implementation details⁵.

System Entities

Every BrainStem module includes a single System Entity. The System Entity allows access to configuration settings such as the module address, input voltage, control over the user LED and many more.

Serial Number

Every USBHub2x4 is assigned a unique serial number at the factory. This facilitates an arbitrary number of USBHub2x4 devices attached to a host computer. The following method call can retrieve the unique serial number for each device.

stem.system.getSerialNumber(serialNumber)

Module Default Base Address

BrainStems are designed to be able to form a reactive, extensible network. All BrainStem modules come with a default network base address for identification on the BrainStem network bus. The default module base address for USBHub2x4 is factory-set as 6, and can be accessed with:

stem.system.getModule(module)

Saving USB Entity Settings

Some entities can be configured and saved to non-volatile memory. This allows a user to modify the startup and operational behavior for the USBHub2x4 away from the factory default settings. Saving system settings preserves the settings as the new default. Most changes to system settings require a save and reboot before taking effect. For example, upstream and downstream USB Boost settings will not take effect unless a system save operation is completed, followed by a reset or power cycle. Use the following command to save changes to system settings before reboot:

stem.system.save()

Pressing the reset button two times within 5 seconds will return all settings to factory defaults: all ports' data and power enabled, CDP mode, enumeration delay of 0, 2500mA current limit.

Saved Configurations		
Software Offset	I2C Rate	
Router Address	Port Enumeration Delay	
Boot Slot	Downstream Boost	
Port Mode (SDP, CDP) – each port	Current Limit – per port	
Upstream Boost	Port state (data and power)	

Table 6: Saved Parameters

⁵ See BrainStem software API reference at <u>https://acroname.com/reference/</u> for further details about all BrainStem API methods and information.

.: ACRONAME

Programmable USB Hub Datasheet S77-USBHub-2x4

USB Entity

The usb entity provide a mechanism to control all functionality for the upstream and downstream USB ports.

USB Downstream Channel Control

Downstream USB channels can be manipulated through the $_{\tt usb}$ entity command to enable and disable USB data and $V_{\tt bus}$ lines, measure current, measure $V_{\tt bus}$ voltage, boost data line signals, and measure temperature.

Manipulating Hi-Speed data and V_{bus} lines simultaneously for a single port can be done by calling the following methods with channel in [0-3] being the port index:

stem.usb.setPortEnable(channel)

stem.usb.setPortDisable(channel)

Manipulating data lines while not affecting the V_{bus} lines simultaneously for a single port can be done by calling the following methods with channel [0-3]. The follow methods provide equivalent functionality; the two methods are offered for compatibility with other products.

stem.usb.setDataEnable(channel)

- stem.usb.setDataDisable(channel)
- stem.usb.setHiSpeedDataEnable(channel)
- stem.usb.setHiSpeedDataDisable(channel)

Manipulating just the USB V_{bus} line for a single port can be done by calling the following method with channel [0-3]:

stem.usb.setPowerEnable(channel)

stem.usb.setPowerDisable(channel)

To affect multiple ports and lines simultaneously, see usb.setHubMode() later in this section.

Note that transitions between power and data enable states where power is enabled and only data is changing require the USBHub2x4 to toggle V_{bus} power. This appears as a port cycle event and the USBHub2x4 hardware will cycle VBUS even if the VBUS/Power setting remains enabled.

USB Downstream Measurements

The USB V_{bus} voltage, as well as the current consumed on V_{bus} , can be read for each channel by calling the following methods with channel [0-3], where the second variable passed into the method is the location for the measurement result:

stem.usb.getPortVoltage(channel, μ V)

 $stem.usb.getPortCurrent(channel, \muA)$

USB Downstream Current Limit

Current-limit settings can be accessed for each port by calling the following methods with channel [0-3]. The second variable passed into the method is either the set value or the write location of the result. The set value can be any value and will be rounded down by the USBHub2x4 to allowed values listed in Table 4. When a connected downstream device attempts to consume more current than the set current limit, the USBHub2x4 will enter a constant-current mode, reducing the V_{bus} voltage until the current limit set point is reached.

stem.usb.getPortCurrentLimit(channel,µA)

stem.usb.setPortCurrentLimit(channel,µA)

The current-limiting behavior follows the USB BC1.2 specification which allows for many different behaviors. The USBHub2x4 has two stages of current-limiting. When a downstream device consumes current higher than the programmed current limit, the hub will enter a "constant current" mode and is indicated in the getPortstate() bitfield with the constant current bit. In the constant current mode, the V_{bus} voltage will be reduced to attempt maintain a constant current at the set current limit. The time and amount of voltage reduction and maximum allowed current draw depends on the current limit set point. Please see figures above for expected V-I characteristics.

As the V_{bus} voltage is reduced, if the device continues to increase its current draw (reduce it's effective resistance), the USBHub2x4 will "trip off" by disabling the V_{bus} and high-speed data lines. This state is indicated with the error bit in the getPortState() bitfield. The Channel X Power error LED will also illuminate when this error occurs. See the LED Indicators section for details.

USB Downstream Operational Mode

The USB port operational mode controls the behavior of each downstream port's charging behavior. Each port can be setup to support different modes in the USB Battery Charge Specification 1.2 (BC1.2). Standard Downstream Port (SDP) mode will cause BC1.2 compliant or older USB devices to consume 500mA or less. Configuring a port as a Charging Downstream Port (CDP) will signal downstream devices that they may consume >500mA. If there is no upstream USB host connected to the hub, downstream ports set to CDP will behave as Dedicated Charging Ports (DCP).

The actual current consumed by the device is controlled by the downstream device and not the USBHub2x4. Devices which are not compliant with BC1.2 or the previous USB power specifications may draw more current than specified above.

The operational mode is set or read by calling the methods:

stem.usb.setPortMode(channel,mode)

stem.usb.getPortMode(channel,mode)

Available options for Downstream Operational Mode are:

Value	Hub Port Mode Descriptions
0	Standard downstream port (SDP)
1	Charging downstream port (CDP)
	Table 7: Hub port mode value description

USB Downstream Enumeration Delay

Once a USB device is detected by the USBHub2x4 it is possible to delay its connection to an upstream host computer and subsequent enumeration on the USB bus. The enumeration delay can mitigate or eliminate host kernel instabilities by forcing devices to enumerate in slow succession, allowing a focus on validation of drivers and software. The enumeration delay is configured in milliseconds, representing the time delay between enabling each successive downstream port from 0 to 3. Enumeration delay is applied when the hub powers on or when a new upstream connection is made.

stem.usb.setEnumerationDelay(delay)

stem.usb.getEnumerationDelay(delay)

USB Boost Mode

Boost mode increases the drive strength of the USB 2.0 Hi-Speed data signals (power signals are not changed). Boosting the data signal drive strength may help to overcome connectivity issues when using long cables or connecting through relays, "pogo" pins or other adverse conditions. This setting is applied after a system.save() call and reset or power cycle of the hub. The system setting is persistent until changed or the hub is hard reset. After a hard reset, the default value of 0% boost is restored. A hard reset is done by pressing the "Reset" button on the back of the hub two times within 5 seconds while the hub is powered.

Boost mode can be applied to both the upstream and downstream USB ports with the follow methods:

stem.usb.getDownstreamBoostMode(setting)

stem.usb.setDownstreamBoostMode(setting)

stem.usb.getUpstreamBoostMode(setting)

stem.usb.setUpstreamBoostMode(setting)

The *setting* parameter is an integer that correlates to the following:

Value	Hub Boost Mode Descriptions
0	Normal drive strength
1	4% increase in drive strength
2	8% increase in drive strength
3	12% increase in drive strength
	Table Outlink baset made value descriptions

Table 8: Hub boost mode value descriptions

USB Hub Upstream Channels

The USBHub2x4 is perfect for environments where multiple devices need to be shared or switched between two host computers using two host (upstream) connections via USB mini-B connectors. The upstream connection can be automatically detected or specifically selected using the following methods:

stem.usb.getUpstreamMode(mode)

stem.usb.setUpstreamMode(mode)

The *mode* parameter can be defined as the following:

Value	Hub Upstream Mode Descriptions
0	Force upstream port 0 to be selected
1	Force upstream port 0 to be selected
2	Automatically detect upstream port
	Table 9: Hub upstream mode value descriptions

Predefined C++ macros for these can be found in aProtocoldef.h, and Python's built-in help interface.

The default operational mode is to auto detect which upstream USB port is selected. Automatic detection uses the presence of V_{bus} on the USB type-B upstream connector to determine presence of a host. i.e. if a host is connected to the Up0 port, then channel 0 will be selected as the upstream USB connection (see Figure 3 for more detail).

Note that in the USBHub2x4, the BrainStem API and control communication path is only available through the actively selected upstream port.

USB Hub Upstream State

The USBHub2x4 can provide status information on which upstream port is actively selected as data path to the downstream ports:

stem.usb.getUpstreamState()

This command returns a 32-bit value which indicates:

Hub Upstream State Descriptions
Upstream port 0 is actively selected
Upstream port 1 is actively selected
No upstream port is selected

Table 10: Hub upstream state value descriptions

USB Hub Operational Mode

In addition to targeting individual downstream USB ports, a bitmapped hub state interface is also available. This interface allows the reading or setting of all USB downstream ports in one functional call.

stem.usb.getHubMode(mode)

stem.usb.setHubMode(mode)

The value mode is 32-bit word, defined as the following:

Bit	Hub Operational Mode Bitwise Description
0	USB Channel 0 USB Hi-Speed Data Enabled
1	USB Channel 0 USB V _{bus} Enabled
2	USB Channel 1 USB Hi-Speed Data Enabled
3	USB Channel 1 USB V _{bus} Enabled
4	USB Channel 2 USB Hi-Speed Data Enabled
5	USB Channel 2 USB V _{bus} Enabled
6	USB Channel 3 USB Hi-Speed Data Enabled
7	USB Channel 3 USB V _{bus} Enabled
8:31	Reserved

Table 11: Hub Operational Mode Result Bitwise Description

USB Port State

Each downstream port reports information regarding its operating state represented in bit-packed results from:

stem.usb.getPortState(channel,state)

where *channel* can be [0-3], and the value *status* is 32-bit word, defined as the following:

Bit	Port State: Result Bitwise Description
0	USB V _{bus} Enabled
1	USB2 Data Enabled
2:18	Reserved
19	USB Error Flag
20	USB2 Boost Enabled
21:22	Reserved
23	Device Attached
24	Constant Current Mode
25:31	Reserved
	Table 12: Port State: Result Ritwise Description

Table 12: Port State: Result Bitwise Description

USB Port Error Status Mapping

Error states for all downstream ports are bit-packed in 32-bit words available from:

stem.usb.getPortError(channel)

where *channel* is [0-3].

Errors can be cleared on each individual channel by calling the following method:

stem.usb.clearPortErrorStatus(channel)

Calling this command clears the port-related error bit flags (see Table 9) in the port error state. Global bits for hub errors cannot be cleared by this command.

Details about the port error status 32-bit word are as follows:

Bit	Port Error Status Bitwise Description	
0	USB port current limit exceeded	
1	USB port back-drive condition detected	
2	Reserved	
3	Hub overtemperature condition	
4:31	Reserved	
Table 12: Port Error Statue Pocult Pitwice Description		

Table 13: Port Error Status Result Bitwise Description

USB System Temperature

The temperature of the USB subsystem in the USBHub2x4 can be measured with:

stem.temperature(0).getTemperature(μ C)

where temperature is in micro-degrees Celsius.

USBHub2x4 Supported Entity Methods Summary

Detailed entity class descriptions can be found in the BrainStem Reference (<u>https://acroname.com/reference/entities/index.html</u>). A summary of USBHub2x4 class options are shown below. Note that when using Entity classes with a single index (aka, 0), the index parameter can be dropped. For example:

stem.system[0].setLED(1) \rightarrow stem.system.setLED(1)

Entity Class	Entity Option	Variable(s) Notes
store[0-1]	getSlotState	
	loadSlot	
	unloadSlot

Table 14: Supported USBHub2x4 BrainStem Entity API Methods⁶

⁶ See BrainStem software API reference at <u>https://acroname.com/reference/</u> for further details about all BrainStem API methods and information.

LED Indicators

Built into the board are a number of LED indicators to assist in system troubleshooting using the USBHub2x4.

Figure 5: USBHub2x4 LED Indicators

The BrainStem Link LED will illuminate when the BrainStem USB interface is created on a host computer.

The Heartbeat indicator informs the user when communication is occurring with the BrainStem module, including a periodic heartbeat signal and response. Additional details on Heartbeats can be found in the BrainStem Terminology section of the Reference Manual.

The Logic Power indicator shows that a 3.3V voltage regulation system is up and running properly.

The User LED is a software controllable indicator accessed via the System BrainStem Entity. Detailed information can be found in the System Entity section of the reference manual.

Each downstream USB connection has LED indicators for status and power. The red LED labeled USB Channel X Power indicates an error on USB power (V_{bus}) such as overcurrent. This LED will automatically turn-off approximately 5 seconds after the error condition occurs. Additionally, a green LED, labeled USB Channel X Status, indicates whether the downstream device has enumerated on the host computer.

The Hub Status indicator illuminates when the USB hub communicates with a host computer.

Using Multiple Hosts with USBHub2x4

The two upstream-facing host ports can be connected to two different host computers. Due to limitations of USB specification and architecture, only one host computer can access downstream USB ports at any time. Through the BrainStem APIs, the upstream port used can be specifically selected, or the system can automatically select the upstream port.

The BrainStem controller connection is available only through the actively selected host port. Because of this, it is important to keep in mind that when a host upstream connection is changed, the software connection to the BrainStem module should follow the upstream connection appropriately.

Figure 6: Determining connection used for BrainStem communications

Mechanical

Dimensions are shown in inches [mm]. 3D CAD models are available through the USBHub2x4 product page's Downloads section

Figure 7: USBHub2x4 Mechanical

Housing Markings

Symbol	Description
@-+	DC barrel connector polarity marking
===	DC line voltage

Table 15: Case Symbol Markings

Input Power Connections

The USBHub2x4 can be powered through the DC barrel-jack on the front of the unit.

Certifications and specifications are only valid with the Acroname provided power supply. Other power supplies can result in unspecified behaviors. Contact Acroname support for guidance on alternative power supplies. Replacement power supplies and AC mains cords are available from Acroname. Acroname recommends against replacing detachable AC Mains supply cord provided with the inadequately rated cords. Replacement power supplies are available Acroname part number: R469-PS-3 (https://acroname.com/store/r469-acdc-ps-3).

The DC barrel-jack is a standard 5.5mm outside diameter, 2.5mm inside diameter, 9.5mm mating length connector. Many manufacturers make compatible mating plug connectors; one example is the DC barrel plug from CUI: part number PP3-002B (https://www.cui.com/product/resource/pp3-002b.pdf).

DIN Rail Mounting

DIN rail mounting provisions have been designed into the USBHub2x4 case. Holes for a DIN rail clip/adapter are provided to allow mounting of the USBHub2x4 to standard DIN rails. Mounting clip hardware is available separately in a kit from Acroname: part number C31-DINM-1. The diagrams below illustrate USBHub2x4 mounted in two orientations:

Figure 8: USBHub2x4 DIN Rail Mount

FCC Compliance Statement

Note: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

```
This device complies with part 15 of
FCC Rules. Operation is subject to the
following two conditions; (1) This
device may not cause harmful
interference, and (2) this device must
accept any interference received,
including interference that may cause
undesired operation.
```

Compliance Information

Product Support

Questions about the product operation or specifications are welcome through Acroname's contact portals. Software downloads, reference API and application examples are available online at:
